Distributed amplification in a quantum memory. A variant of distributed quantum amplification that enables simultaneous measurement of large numbers of copies of an unknown quantum state is demonstrated. The network is based on dual-rail encoding of qubits in a three-level atomic system in an optical cavity. Microwave probe fields are used to individually detect photons in each cavity and these results are used to determine the amplified copies. We describe a proof-of-principle experiment with rms noise of $\delta\Phi = 0.014$ over 8 different polarizations for each of 3 qubits.

Q: I cannot use Google Connected Play service in my Android application I've created an Android application which is requiring Google Connected Play service to activate some features. In order to add the library project (Google-Play-Services-lib) I've added the same Project and ModuleName in my app module but when I run the application it crashes with: java.lang.IllegalArgumentException: No project found for "android.support.v4.app.CoreComponentFactory" A: CoreComponentFactory is a nested library project. You need to include it in the Android Studio project that you're referencing from. You can do this by right clicking the module in the Project View and selecting Referencing Module From Project. This will then let you add the CoreComponentFactory as a Module on your module.
