The different modes of host control include: ◆ Passive host mode ◆ Host detection mode ◆ Passive host mode ◆ End of monitoring mode 2. General Information: 2.1. What is Socket Control? Socket Control is a software solution that allows you to control multiple real or virtual hosts. All hosts can be controlled in a looped fashion, or one host can be monitored. Socket Control is used in order to watch or control active hosts, like your "server" or "network" machines. Socket Control allows you to open any number of TCP and

UDP connections to passive hosts (in "monitoring" and "passive host mode") and to send and receive data from them. Socket Control includes preconfigured lists of IP addresses, host names, DNS servers, URL or host name lookups, memory cards, forwarding agents, and much more. If you need to control your own hosts directly from your own computer without relying on remote hosts you can use an "arbitrator" mode where you can connect directly to your own hosts. The arbitrator mode of Socket Control can also be used as a "forwarder" which forwards incoming data to your own computer. This is great when 3a67dffeec

This tool was designed to be a simple graphical tool for opening and closing socket connections. The user doesn't have to understand any programming knowledge to use it, he just selects an active or passive socket connection, closes it and opens a new one. Additional features: □ TCP/UDP connection opening and closing □ Up to 64 active connections □ Remote control from other hosts, storing the data in a text or comma delimited file Result : When you select the first option and click on [Add Connection], it will show you a dialog box that you have a list of all your active and passive connections, the active connections will be shown in red and passive ones will be shown in light gray. Select the connection that you want to close and press [Close]. This will close the connection. Then open a new one. When you select the second option and click on [Add Connection], it will show you a dialog box that you have a list of all your active and passive connections, the active connections will be shown in red and passive ones will be shown in light gray. Select the connection that you want to close and press [Close]. This will close the connection. Then open a new one. You can also select a file and open the connections from that file. In the case that you want to access your default network interface, instead of entering your IP and port, you can enter an IP address that you want to search. If the IP address is not available in your server, it will show an error. When the search is completed, the result will be shown below the main window. If the IP address is unconfigured on your server, if you entered an IP address that is not available, it will show an error. The most common cause of the error is the incorrect IP address. If you did not enter the correct IP address, you have to enter the IP address of the network interface that you want to connect to. If you did not enter an IP address, it will try to connect to the NAT address provided by the router, this could cause connection problems.
