Share this article on LinkedIn Email The Formula 2 series will introduce a new specification of car for 2015, with Mazda developing a new turbocharged engine to power the new regulation. The series will run a spec car based around a 'virtual motor', which is a combination of components from existing engines with an aim of reducing the development costs. Mazda Racing boss John Grant told Autosport that the new engine is a technological step forward for F2, but could also be adopted in the F1 world should the trend become commonplace in other forms of motorsport. "The first thing is there was nothing like it in F2 at the moment," Grant said. "There was nothing like the traction control and the electronic dampers, the ABS and the other traction control that came with the new car. "The electronic front diff [we have now] is fundamentally different - much faster, better, and effective. "But the whole basis of the car is a new electrical system and a new turbo. "It's a mechanical standardised package that could then be put into Formula 1. I think there's plenty of scope for that." Grant said that Mazda's experience in F1 would add more to the package, although he admitted the relationship between F1 and F2 was not as strong as with MotoGP. "The relationship is closer to formula racing than grand prix racing and that's what F1 originally was," he said. "You could have a Formula 1 car and put that on a racing track, because it was essentially a road car built in a high-speed environment. "It's much closer to the category because of the engine specification in this generation of F1 is almost the same as we'd run in F1." Grant is happy to see the series expand its footprint and boost the series' popularity. "The idea behind it is to grow the category,"

## What's New in the SimulIDE?

Have you ever wondered what could be the simplest, yet the most effective circuit simulator out there? Then, SimulIDE is the perfect tool that you could use. SimulIDE is a software that includes a simulation tool and a circuit analyzer. You can make a circuit by going to the simulation tool. The circuit analyzer tells you what signal changes (when in time) for the cells/outputs. Then you can go to the list of Circuit List and apply a voltage. When you do that, the cells that are connected to the cell/output get a higher voltage. When you increase the voltage, the cell changes to a different code, depending on the type of cell. The first cell is a. Then, the cell has: 19k, 20k, 21k, 16k, 18k, and 11k. If you run the simulation, you can see that the voltage rises until the 20k, and then the program changes from 20k to 21k. SimulIDE Software Description: Simulide is a circuit and design software designed for beginners and professional engineers alike. Because it is so easy to use, if anyone can use and follow a tutorial, he or she can program any circuit. There are about 25 circuits already programmed for you. The circuits range from simple circuits to highly complex circuits. This new release of CircuitStudio is software that includes a 2-D schematic editor, simulation, and an oscilloscope. With it, you can make your circuit with the schematic editor and simulate or oscilloscope it to get realistic results from a single time unit. When you simulate an oscilloscope, you can see how the signal changes in time, and if you open the oscilloscope, you can see the same simulation. You can create circuits and oscilloscope them. CircuitStudio 2.1.2 Description: CircuitStudio is a circuit and design software designed for beginners and professional engineers alike. It is easy to use, no matter if you are a beginner, a professional engineer, or a hobbyist. You can program any circuit by following a tutorial and then make a 2-D Schematic. You can simulate your circuit by choosing simulation or oscillo. In addition to the simulation software, you can oscilloscope your circuit or see the results directly on the screen. CircuitStudio enables you to get detailed results, which may be useful for improving the design. These days, it is common for people
