Users can create 2D and 3D architectural and engineering drawings with editing features such as dimensioning, annotating, and text. These drawings can then be used to produce printable versions for marketing. The AutoCAD software is used to create the majority of the designs of buildings and structures found in the US. As of December 31, 2014, Autodesk reported that AutoCAD has been installed on computers and mobile devices of more than 300 million people. Quick Facts The first AutoCAD was a trial version released in 1982 to architects, mechanical and electrical engineers, and others interested in CAD. It was sold for US\$400. , the most popular version of AutoCAD, has been installed on more than 300 million devices. AutoCAD was developed by Peter Frenkiel and his design team at the Stanford Design Group. AutoCAD is owned by Autodesk, a software development company founded in 1980 by a team led by Frank Gates and Steve Sasson. History AutoCAD is based on the experience of Peter Frenkiel, who was introduced to the history of the CAD industry by his professor, architectural historian Paul Rudolph. While studying at the Stanford Design School in the 1970s, Frenkiel was involved with the creation of Computer-Aided Design (CAD) tools, which would eventually become AutoCAD. Originally called AutoCAD II, the first version of AutoCAD was released in December 1982 as a 32-bit microcomputer version, licensed exclusively for use in American companies. The first published application for AutoCAD was by the American company Ernst & Whinney. The first version of AutoCAD, later called AutoCAD 1.0, was released as a desktop app that ran on any 32-bit microcomputer with an internal graphics controller. The program, published by Autodesk, was built for engineering and architectural professionals. This version was the first to allow 3D modeling of architectural and engineering drawings. AutoCAD 1.1, released in August 1983, offered many new features, including a drawing manager, the ability to print, additional tools, an integrated drafting area, and many new commands. The ability to export drawings as a printer file for printing was introduced with AutoCAD 1.2 in September 1984. With version 1.2, the number of commands in the AutoCAD system was increased to

Macro language The macro language of AutoCAD, which allows automation of many tasks, provides a special category of macros called programming macros. This type of macro is more powerful than the regular macros, and is designed for programming, not for describing. Each programming macro consists of a command and an argument list. Each command is a macro which is executed repeatedly until the macro ends. The arguments to the command are the values of the variables used in the macro, which vary depending on the command. AutoLISP is a programming language that is closely related to Visual LISP. AutoLISP is used primarily by the Autodesk Revit, A360, and Design Workbench software packages. AutoLISP provides a method for viewing and modifying information in Revit. Visual LISP is a programming language for creating macros. It is an extension to Visual LISP, and is available as part of the Autodesk Visual LISP software. It is used to create macros

for AutoCAD. Visual Basic for Applications is a part of the Microsoft Office system. It provides a way for non-technical users to create macros for their documents in addition to the normal programming macros. Microsoft.NET is a programming language for creating macros and ActiveX components. It is available as a free download for Windows NT/2000/XP. It is possible to create AutoCAD macros with .NET. ObjectARX is a class library for developers that allows them to create functionality that is integrated with AutoCAD. This class library is being replaced by other technologies that are being created for developers. General characteristics of macros: Macros consist of a command and arguments, in the same way as programs or functions in many programming languages. For example, in the program listing below, the get-height and get-width commands are macro commands and the 0 0 value for the x and y arguments are arguments. Each macro command may take arguments, and each argument may be replaced by a different value. The replacement of arguments can be organized into a command loop in the same way as function calls. For example, in the above command, the macro has executed once. The arguments have been replaced by the values specified. In this program, the command has not yet terminated, and the macro can be used to execute the same commands multiple times: The above command adds two numbers and prints the result. The output is: Macros are usually executed in conjunction with other AutoCAD ca3bfb1094

In the Autocad, type "Print" in the Quick Search box. The print dialog box will pop up. Select your printer name from the drop down box. Select "File > Print." You should get your license key for free (providing you're installing it on a new computer) Q: How can I tell if a file has been changed in git I'm writing a script to upload a set of files to a git repository. If the file has not been changed, I want to skip the upload. I know that I can read the file and then check for the last modified timestamp, but is there a more elegant way? I think this is basically the same question as Check if file has been modified in git, but it's a bit more involved because I'm dealing with multiple files. I would like to do this in a portable way, so if the OS or version of git changes I don't need to update the code. A: you can use git diff to check for a difference between two commits: git diff commit1 commit2 If you don't want to use a more sophisticated library you can write your own function to do this: function hasChanged(\$filename) { \$handle = fopen(\$filename, 'rb'); \$isChanged = (filesize(\$handle) != 0); fclose(\$handle); return \$isChanged; } A: I don't think there is a way to directly check whether a particular file has changed since a particular commit, but you can do the following: Check to see if the commit is available in the branch your script is currently running on (this is the "modern" way to do the check): \$ git rev-parse HEAD This should give you the commit-id of the latest commit on the branch your script is currently running on. If the commit-id is available, check to see if the files in the given folder have been changed since that commit (this is the "old" way to do the check): \$ git ls-tree HEAD folder/ You can see the details on how to do this here. The ls-tree command will return the commit object of the commit if the file you're checking has been changed. A: You can use git ls-
