Once the image is imported into Lightroom it is time to start working. The new Automate module in Lightroom 5 does exactly what it says on the box. You can create some amazing effects with automation. The list of actions is extensive, and includes color, motion, and other types of adjustments. I am not going to mention all of them, but I will give you a few ideas. I like a lot of stacked action sequences. I wanted to have the effects of a sunset and sunrise, so I created a “stacked sunset” action, which consists of a sequence of adjustment layers, a Black & White adjustment layer, and bulk noise reduction used to make the horizon line less visible. I also used a set of custom actions to create a “stacked sunrise” that consisted of action layers to make the sky lighter. Of course, the sky was always blank with no color. I used a similar approach with some different color effects. The quality of the existing actions is surprisingly good, and worth trying out. But the best thing is that it is free of charge. Starting with the organizational tools in Lightroom 5, I found five categories: “Recent”, “Recent footage”, “Compose”, Library (which also has four sub-folders, “History”, “Collections”, “Images”, and “Cached”,) and History & Cache. The Photoshop interface itself takes advantage of the iPad Pro’s large screen. Photoshop opens in landscape and Photoshop Project preview in portrait. That means you need enough room to view the full canvas. If you’re working on a smaller display, your document is scaled down instead. Moreover, you can import a Photoshop PSD from your computer by clicking the File menu and selecting Open. As your project moves from document to the iPad Pro, you can edit images on the iPad at any time—but if you switch to the computer, you lose the ability to make changes to your image. That’s a slight drawback, even if it’s the most accurate rendition if we’re talking about the real-world purposes of a digital photo.

So, what does this mean for people? Both Photoshop on the web and Photoshop for iOS have always offered a set of powerful selection and editing tools in addition to one another. Now you can use them side by side to create empowering workflows. Photoshop for Mac, available in the Creative Cloud Desktop App, also has many of the same selection and editing tools. Some of the features that have been discontinued for Photoshop on the web include the 3D toolset that has been specifically designed for creating 3D projects. This transition is primarily focused on adding the new layers features that let you combine 2D layers and edit them using 3D tools. If you head to <http://www.adobe.com/creativecloud>, you'll see a new set of icons there that indicate whether the feature is available on the web or in a desktop app. You can switch between the two using the pull-down menu, or use the new icons. In the next couple of weeks we'll have a brand-new Photoshop site. The site is fully responsive and designed to be mobile-first, so you'll be able to get the latest features, learn about Photoshop compatibility with specific devices and operating systems, find out how to get started with Photoshop CC, and much more. The selection tools and edit controls are meant to be consistent with the look and feel of the rest of Photoshop. Rendered artboards and modes, including creation guidelines, filmstrip, and guides and other annotations, will be available. We'll continue to consult with users to make sure we deliver the widest compatibility set possible, and build out features to ensure that Photoshop on the web is as robust a tool set as possible. We could include more features like the link layer in all digital photography applications, but that might simply be too much.
