Adobe just announced a new editing feature that will be very popular among those who edit film and video: a new timeline. It is based on CinemaDNG, a new industry standard for photo media and it's a working project of the Academy of Motion Picture Arts and Sciences. Aiming to bring the features of editing film and video to photo editors, this new timeline brings the familiar film and video timeline into Photoshop. You can now timeline up to 12 tracks in a single file. The release of Photoshop CC 2018 also brought new features to the desktop version of Photoshop CC. A new layer panel now has two new buttons, Duplicate and Freeze. These allow for multi-layer editing and as a new editing feature, Freeze lets you copy and edit one section in your image without editing other parts of it. Adobe has also made the RAW setting more flexible than ever, allowing creatives to do more with images in less time. Adopting the Single Channel, RAW process, photographers can create professional images without loading and managing individual files. In a move to reduce the time of editing, Photoshop adds the ability to make selections, create and customize masks and refine other aspects in RAW files. Adobe Photoshop is optimized to handle files that are the same size as their source document, and its layers and channels are made available for processing in real-time with no extra downloading. And if you want to ensure image quality, Photoshop includes the Camera Raw file open time and has features for resizing, de-noising, sharpening, color adjustment, recomposing, cropping, and more. Calibrating the camera has never been easier. Adobe Photoshop Elements for Mac offers all these advantages, plus scads of small, but important features, including face recognition for people in your photos, object tracking in videos, and smart color cropping and split-toning.
